EXPT NO: 3 A python program to implement Logistic Model

DATE: 6-9-24

AIM:

To write a python program to implement a Logistic Model.

PROCEDURE:

Implementing Logistic method using the iris dataset involve the following steps:

Step 1: Import Necessary Libraries

First, import the libraries that are essential for data manipulation, visualization, and model building.

Step 1: Import Necessary Libraries

import numpy as np

import pandas as pd

import matplotlib.pyplot as plt

from sklearn.model_selection import train_test_split

from sklearn.linear_model import LogisticRegression

from sklearn.metrics import accuracy_score, confusion_matrix, classification_report

Step 2: Load the Iris Dataset

The iris dataset can be loaded.

Step 2: Load the Dataset

For this example, we'll use a built-in dataset from sklearn. You can replace it with your dataset.

from sklearn.datasets import load_iris

```
# Load the iris dataset
data = load_iris()
X = data.data
y = (data.target == 0).astype(int) # For binary classification (classifying
Iris-setosa)
```

Step 3: Data Preprocessing

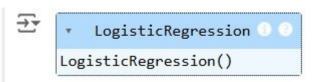

Ensure the data is clean and ready for modeling. Since the Iris dataset is clean, minimal preprocessing is needed.

```
# Step 3: Prepare the Data
# Split the dataset into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2,
random_state=42)
```

Step 4: Train a Model

```
# Step 4: Create and Train the Model
model = LogisticRegression()
model.fit(X_train, y_train)
```

OUTPUT:

Step 5: Make Predictions

Use the model to make predictions based on the independent variable.

```
# Step 5: Make Predictions
y_pred = model.predict(X_test)
```

Step 6 : Evaluate the Model Evaluate the model performance.

```
# Step 6: Evaluate the Model

accuracy = accuracy_score(y_test, y_pred)

conf_matrix = confusion_matrix(y_test, y_pred)

class_report = classification_report(y_test, y_pred)

# Print evaluation metrics

print(f"Accuracy: {accuracy}")

print("Confusion Matrix:")

print(conf_matrix)

print("Classification Report:")

print(class_report)
```

OUTPUT:

```
→ Accuracy: 1.0
   Confusion Matrix:
   [[20 0]
   [ 0 10]]
   Classification Report:
              precision recall f1-score support
                  1.00
                          1.00 1.00
                                              20
                   1.00
                           1.00
                                    1.00
                                              10
                                   1.00
                                              30
      accuracy
   macro avg 1.00
weighted avg 1.00
                          1.00
                                   1.00
                                              30
                          1.00
                                  1.00
                                              30
```

Step 7: Visualize the Results

Plot the original data points and the fitted regression line.

```
# Step 7: Visualize Results (Optional)
x_values = np.linspace(-10, 10, 100)
```

```
# Plot the sigmoid function

plt.figure(figsize=(10, 5))

plt.plot(x_values, sigmoid_values, label='Sigmoid Function', color='blue')

plt.title('Sigmoid Function')

plt.xlabel('x')

plt.ylabel('\sigmoid')

plt.grid()

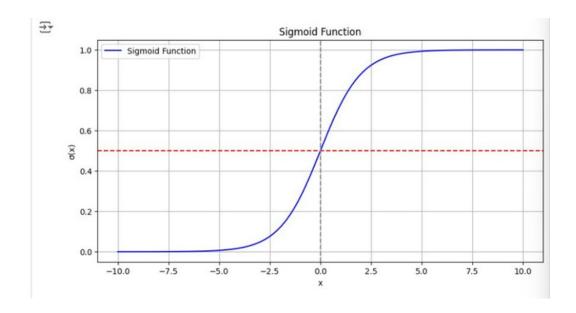

plt.axhline(0.5, color='red', linestyle='--') # Line at y=0.5

plt.axvline(0, color='gray', linestyle='--') # Line at x=0

plt.legend()

plt.show()
```
